# Do We Truly Need Another Series of Articles on Disruption and Delay?

Alexander Voigt and Sam Mattar – On Disruption and Delay

Does the world truly need yet another series of articles on disruption and delay? Actually, yes, it does. In order to better understand the complexities of disruption and the intricacies of its relationship with delay, a new perspective is required... and this is exactly what the System Dynamics method provides.

Since we are fully aware that System Dynamics is not yet a household name in the construction or engineering industries, this series of articles will start by looking at the basics and then, step by step, it will move on to the more challenging, complex, and perhaps even controversial topics. We will try to keep the articles short, and each one will be focused on a single insight / point of contention.

Last but not least, please know that we very much welcome your feedback. If you feel that your experience is reflected in our texts, if this is not the case, or even if you would simply like to suggest additional topics to be addressed... please let us know!

Thank you for being here,

The CDS Team.
